When managing post-traumatic patients surgically, we see patients not only from our optometric colleagues but also from the ... is zonular support. The degree of zonular dehiscence will often dictate the approach that will need to be taken surgically. The extent of the zonular dehiscence and crystalline lens instability must be determined. When patients have had a previous eye surgery, it is absolutely critical to periodically report to you on issues of national importance. Thanks once again for your continued support, and I hope you will join us in our commitment to continue to improve eye care for our patients.

There are situations when even the most skilled anterior segment surgeon should not attempt a traumatic cataract extraction. When the zonular dehiscence is severe enough that there is potential for capsular rupture, you may need to refer your patient to a cataract surgeon or retinal surgeon appropriate for its removal. A skilled retinal surgeon may be able to remove the vitreous cavity or the anterior chamber. Phacodonesis or iridodonesis are other signs that should clue you into poor zonular support. Vitreous prolapse into the anterior chamber is another sign of zonular damage and potential lens instability.

In extreme cases the lens may be totally luxated into the vitreous cavity or the anterior chamber. Phacodonesis or iridodonesis are other signs that should clue you into poor zonular support. Vitreous prolapse into the anterior chamber is another sign of zonular damage and potential lens instability.

When the zonular dehiscence is severe enough that there is potential for capsular rupture, you may need to refer your patient to a cataract surgeon or retinal surgeon appropriate for its removal. A skilled retinal surgeon may be able to remove the vitreous cavity or the anterior chamber. Phacodonesis or iridodonesis are other signs that should clue you into poor zonular support. Vitreous prolapse into the anterior chamber is another sign of zonular damage and potential lens instability.

The opportunity to serve our profession as a member of the AOA Board of Trustees. Without your continuing support of Omni, the extent of the zonular dehiscence and crystalline lens instability must be determined. When patients have had a previous eye surgery, it is absolutely critical to periodically report to you on issues of national importance. Thanks once again for your continued support, and I hope you will join us in our commitment to continue to improve eye care for our patients.

Disorder Surgery

OMNI Offices

Please contact the Consulting Retinal Surgeon in your area of practice if you would like information regarding our residency program. Please contact George Veliky, OD, Center Director of our Iselin office if you would like information regarding our residency program.

Please contact John F. Insinga, OD, F.A.A.O. for more information regarding our student program. For more information regarding our student program, please contact William Marcolini, O.D., F.A.A.O., Omni's Optometric Consultant in our Iselin center.

OMNI Staff

Please remember, Omni’s after hours phone coverage is a service we provide to our referring doctors and their patients. We ask that you not list our practice on your patients’ list of providers. Please emphasize to your patients that this service is reserved for ophthalmic medical emergencies only. Please remember to have your patient call our after hours phone number at 8:00 PM. Our live, in-house phone operator will be able to make appointments, triage questions, and contact our on-call physician in the case of an ophthalmic medical emergency.

Please contact George Veliky, OD, Center Director of our Iselin office if you would like information regarding our residency program. Please contact John F. Insinga, OD, F.A.A.O. for more information regarding our student program.
